

TEACHING STATEMENT

Jim D. Pham

7/2/2026

My educational philosophy revolves around nurturing both values and knowledge in every unique student. I see each learner as an individual with their own talents and perspectives, and I am dedicated to guiding them on a journey of discovery that empowers them to grow and thrive. I believe anyone can learn nearly any subject, which is why I support lifelong learning and continuously pursue my own education, as demonstrated in my professional portfolio.

I believe that teaching is a noble profession. As an educator, my aim is to positively influence my students' lives and equip them for a world increasingly shaped by artificial intelligence (AI) and digital technologies. My vision of an ideal teacher transcends traditional classroom instruction; it entails the continuous development of innovative teaching methods. Integrating current AI into the learning environment to assess student outcomes is a natural progression for educators today. This is the approach I adopt in my teaching, striving to make learning an enjoyable experience and preparing the next generation for the future.

Building on previous advancements in Internet and Cloud Computing that ignited a revolution, the collaboration between the Internet of Things (IoT) and AI is elevating learning to unprecedented heights. These technologies have become essential tools for communication, instruction, and learning in modern society. By harnessing these technologies, educators can ignite student engagement and cultivate meaningful collaboration in their coursework. I aspire to become a transformative educator who embodies passion, creativity, and a commitment to inspiring others.

Finally, I promote and support problem-solving rather than simply offering predetermined solutions. The learning environment I foster is collaborative and democratic, encouraging all participants to share their ideas and receive feedback from both their peers and me. This ongoing feedback, whether positive or negative, is an important means of evaluating problem-focused teaching.
