

Jim Pham
Final Reflection
10/25/2006

1. The most important “thing” learned about technology in this course.

Like it or not, our education system and entire society are changing in a changing global context, and information technology is a huge part of this change. I believe that information technology is just the beginning of the major paradigm shift in education—creating and delivering knowledge via technology.

Having worked in the field of information technology and looking at today’s society, I understand that information technology has shaped many institutions, including schools, government, and industry. Many of these businesses and schools are looking for ways to restructure to increase their flexibility and effectiveness during this time of change. Bill Gates has talked extensively about these changes, including the incorporation of business practices into day-to-day operations. So, the future of higher education is not only about information technology but also geared towards lifelong learning and learning communities.

Furthermore, I believe that education is the key sector of our society that can prepare students for this new world of the information age. For this reason, education leaders need to understand technology and develop partnerships with other colleges and communities to build successful change practices for their institutions.

Lastly, Bill Gates’ book is very interesting to read. At least in each chapter of Bill Gates’ book, he talks about Microsoft Company and its products. Bill Gates would explain how Microsoft uses technology to solve business processes, marketing, product development, product delivery, and customer service.

2. How this learning will shape your attitudes and demonstrated behavior as a professional leader.

I believe that information technology is, and may remain, the most important component of the future of higher education, and it continues to change very rapidly. Recognizing these changes, I believe the challenge facing the future of leadership in higher education is incorporating technology into the teaching and learning environment. I have mentioned before that a new era of higher education represents a major paradigm shift, and it affects the people who use it socially, culturally, and even politically. For these reasons, future leaders need to be technology-literate in addition to having a strong understanding of business operations. Some of the most important skills for future leaders include policy, management, and technology; curriculum; facility planning; and funding for technology.

I firmly believe that technology is not limited to businesses; institutions are using it to improve teaching and learning, work processes, and communication as well.
